Real time graph on panel
Graph with electronic extensometer
Graph comparison point tracing
FIE introduces its new model of universal testing machine with design flexibility, a modern appearance and high performance electronics. Some of the features include:

- Open type cross head
- Hydraulic wedge action grips
- Long test stroke and test space
- Loading Accuracy as high ±1%
- Straining at variable speeds to suit a wide range of materials
- Windows based Touch screen control panel with printing connectivity
- Tension, Compression and Transverse test facility.
- Motor Driven Threaded Columns for quick effortless adjustment of middle crosshead to facilitate rapid fixing of test specimen
- Simple controls for ease of operation
- Robust straining frame of an extremely rigid construction.
- Safe operation insured by means of safety devices
- Fully enclosed and protected pressure transducer
- Manual Control and Release valve operation

**Application**

FIE Front Loading Hydraulic Grip Universal Testing Machine is designed for testing metals and other materials under tension, compression, bending, transverse and shear loads. Hardness test on metals can also be conducted.

**Principle of Operation:**

Operation of the machine is by hydraulic transmission of load from the test specimen through pressure transducer to a separately housed load indicator. The system is ideal since it replaces transmission of load through levers and knife edges, which are prone to wear and damage due to shock on rupture of test pieces. Load is applied by hydrostatically lubricated ram. Main cylinder pressure is transmitted to the pressure transducer housed in the control panel. The transducer gives the signal to the electronic display unit, corresponding to the load exerted by the main ram. Simultaneously the digital electronic fitted on the straining unit gives the mechanical displacement to the electronic display unit. Both the signals are processed by the microprocessor and load and displacement is displayed on the digital readouts simultaneously.

**Machine consists of:**

**Straining Unit:**

This consists of a cylinder motor with chain & sprocket drive and a table coupled with the ram of the hydraulic cylinder, mounted on to a robust base. The cylinder and the ram are individually lapped to eliminate friction. The upper crosshead is rigidly fixed to the table by two strengthened columns.

The lower cross-head is connected to two screwed columns which are driven by a motor. Axial loading of the ram is ensured by relieving the cylinder and ram of any possible side loading by the provision of ball seating.

An displacement scale with a minimum graduation of 1mm, is provided to measure the deformation of the specimen.
Tension test is conducted by gripping the test specimen between the upper and lower crossheads.

Compression, transvers, bending, shear & hardness tests are conducted between the lower crosshead and the table.

The lower crosshead can be raised or lowered rapidly by operating the screwed columns, thus facilitating ease of fixing of the test specimen.

Typical HGFL design includes a basic universal testing machine frame with open type crossheads & hydraulic wedge action grips.

**Control Panel**

The control panel consists of a power pack with drive motor, oil tank, Control Valves and PC based Electronic Display Unit.

**Power Pack:**

The power pack generates the maximum pressure of 200 kgf/cm². The hydraulic pump provides continuously non-pulsating oil flow. Hence the load application is very smooth.

**Hydraulic Controls:**

Hand operated wheels are used to control the flow to and from the hydraulic cylinder. The regulation of the oil flow is infinitely variable. Incorporated in the hydraulic system is a regulating valve, which maintains a practically constant rate of piston movement. Control by this valve allows extensometer reading to be taken.

Another power pack is used to operate wedge action grips by means of hydraulic cylinder by using solenoid valve operation.

For Hydraulic Wedge action grips separate control remote is provided with selector switches indicating clamp – declamp and null positions.

- Clamping jaws for flat specimens of thickness.
  - mm | 0-10 | 0-10 | 0-10 | 0-10 | 0-10 | 0-10 | 0-10 | 0-10 | 0-10 |

| Width | mm | 50 | 50 | 65 | 70 | 70 |
| Pair of compression plates of dia. | mm | 120 | 120 | 120 | 120 | 160 |

### FOR COMPRESSION TEST

| Table with adjustable rollers width of rollers. | mm | 160 | 160 | 160 | 160 | 160 |
| Diameter of Rollers | mm | 30 | 30 | 30 | 50 | 50 |
| Maximum clearance between supports | mm | 500 | 500 | 500 | 600 | 800 |
| Radius of punch tops. | mm | 6,12 | 6,12 | 12,16 | 16,22 | 16,22 |

### SPECIAL ACCESSORIES & OPTIONS:

- Load stabilizer
- Printer
- Motor movement resolution of 0.01 mm
- Mechanical Extensometer
- Bristel Test attachment
- Electronic Extensometer
- Software packages
- Shear Test attachment
- Extended Tensile & Compression clearance

Wide range accessories offered on request at additional cost.

- Due to constant R & D specifications & features are subject to change without notice.
- The dimensions given above are approximate.
